

CARE OF YOUR PROVISIONAL CROWN

1. Eat only soft foods. Do not eat anything hard or sticky.
2. Brush and floss your teeth, but when you floss around the provisional crown, pull the floss out through the side; do not pull it up through the top.
3. Chew your food on the other side of your mouth as soon as possible.
4. If tissue is irritated around provisional crown, rinse with warm salt water several times a day.
5. Sensitivity of the tooth may be non-existent to mild. If there is more than a minor amount, please call the office.
6. If the provisional does come off, rinse your mouth with warm water and place the provisional back on your tooth. We will see you soon to secure it in place.
7. It is important that you realize the provisional crown is meant to be in your mouth for a relatively short amount of time, and it can come out somewhat easily.
8. Please be very careful with it. If you have problems or questions, please call our office at 480.948.0560.
